

## **FARMING UPDATE**

On 5 October 2022

I planted lettuce seeds in 50 bottles at a seed distribution of roughly 4 seeds per bottle. I then covered the seeds with a light coating of compost and applied 15ml of 1g/ltr concentration of fertiliser. Water was also put in the water compartment.

Some bottles have been put in the shade for now while others have been put in a spot with a bit of sunshine.

On 7 October 2022

I checked the bottles in the morning. They still had water in them but the level was lower in some bottles.

On October 8

Mati replaced the water in the bottles and some seeds started sprouting.

On October 9

Replaced some water and more lettuce seeds have started germinating. Main concern is about seeds that were displaced towards the sides of the containers.

On October 10

I replaced the water in all bottles and noted the need for a change in water holding container design to allow easy detachment of the bottle sections
